

Sample exports needed — one of each

Advanced Orthopaedic Surgery Centre · so the report router can learn to recognise, name and file each report automatically, the way it already does the daily sale report. One sample each is enough. (S195, 22-Aug-2026)

#	Report	Where it comes from	How to produce the sample
1	Bill-wise purchase	Marg — medical PC	The report printed monthly for purchase verification. Export to Excel instead of (or as well as) printing, any recent month.
2	Supplier-wise monthly	Marg — medical PC	The supplier summary printed alongside #1. Export to Excel, same month as #1 if possible.
3	Stock report	Marg — medical PC	Whichever stock report is actually used (current stock / dump stock). Export to Excel.
4	Purchase register	Marg — medical PC	The register/day-book style purchase listing, any recent range. Export to Excel.
5	Labmate export	Labmate — lab PC	Whatever Labmate exports today (the monthly summary Excel is fine). Copy the file as-is — no need to rework it.
6	Docterz export	Docterz — reception PC	The consultation/collection export already produced (e.g. consultation_report CSV). One recent file as-is.

Where to put the samples: anywhere in **D:\Downloads\margsync** on manojz (a folder called **SAMPLES** is fine), or the Drive folder **Clinic Data Archive** → **ToMedical** works in reverse too — just tell Cowork they are there.

Why filenames don't matter: the router identifies a report by its *content* — title row and column headers — never by its name. Any **REPORT_x.XLS** is fine.

What happens next: each sample teaches the router one signature (~20 min each). From then on that report type is recognised, renamed by the dates of the data inside it, and archived automatically — no manual sorting again.
